Sequence 23643, Application US/09252991A

Parent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

SEQ ID NOS: 33142

A;Note: the list of introns is incomplete; defects in this gene can result in Ehlers-Danl
C;Complex: type III collagen is a homotrimer of monomers initially linked by disulfide bc
er of their length, is formed with desmosine cross-links made from lysine and allysine re
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A; Description: structural component of extracellular fibrous polymer that maintains integ C; Superfamily: collagen alpha 1(I) chain; fibrillar collagen carboxyl-terminal homology; C; Keywords: coiled coil; Ehlers-Danlos syndrome; extracellular matrix; glycoprotein; hydis; F; 1-23, Domain: signal sequence #status predicted <SIG>
F; 24-153, Domain: amino-terminal propeptide #status predicted <PRO>
F; 19.190, Domain: von Willabrand factor type C repeat homology <VWC>
F; 154-121, Product: collagen alpha 1(III) chain #status predicted <MAT>
F; 154-167, Region: amino-terminal nonhelical telopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A;Molecule type: DNA

Biochim. Biophys. Acta 1089:241-243(1991).
-!-FUNCTION: Collagen type III occurs in most soft connective tissues along with type I collagen.
-!- SUBUNIT: Trimers of identical alpha 1(III) chains. The chains are linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.
-!- PIM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PTM: O-linked glycan consists of a Glc-Gal disaccharide bound to the oxygen atom of a post-translationally added hydroxyl group (By

-!- FUNCTION: Voltage-sensitive calcium channels (VSCC) mediate the entry of calcium ions into excitable cells and are also involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in a variety of calcium-dependent processes, including muscle contraction, gene expression, cell motility, cell division and cell death. The isoform alpha-1S gives rise to L-type calcium currents. Long-lasting (L-type) calcium channels belong to the "high-voltage activated" (HVA) group. They are blocked by dihydropyridines (DHP), phenylalkylamines, benzothiazepines, and B omega-agatoxin-IIIA (omega-aga-IIIA). They are however insensitive to omega-conotoxin-GVIA (omega-CTx-GVIA) and omega-

CHANNEL ACTIVITY. THE AUXILIARY SUBUNITS BETA AND ALPHA-2/DELTA LINKED BY A DISULFIDE BRIDGE REGULATE THE CHANNEL ACTIVITY. AN ADDITIONAL GAMMA SUBUNIT IS PRESENT ONLY IN SKELETAL MUSCLE L-TYPE CHANNEL (BY SIMILARITY).

SUBCELLULAR LOCATION: Integral membrane protein.

TISSUE SPECIFICITY: Skeletal muscle.

PTM: MAX NOT BE PHOSEPDORYJATED.

SIMILARITY: Belongs to the calcium channel alpha-1 subunits
                                                                                                                                                                                                                                                               PRINTS; PRO1634; LVDCCALPHAIS.

Ionic channel; Transmembrane; Ion transport; Voltage-gated channel; Calcium channel; Glycoprotein; Repeat; Multigene family; Calcium-binding; Phosphorylation.

            thermoautotrophicum contains sequence motifs characteristic for enzymes containing molybdopterin dinucleotide.";

Eur. J. Biochem. 234:910-920(1995).

-!- FUNCTION: CATALYZES THE REVERSIBLE OXIDATION OF CO(2) AND METHANOFURAN (MFR. TO N. FORMYLMETHANOFURAN (CHO-MFR). CAN ONLY OXIDISE FORMYLMETHANOFURAN. THIS ENZYME IS OXYGEN-LABILE.

-!- CATALYTIC ACTIVITY: Formylmethanofuran + H(2)O + acceptor = CO(2)
                                                                                                                                                 -!- COFACTOR: Tungsten.
-!- PATHARY: Methanogenesis; first step.
-!- SUBUNIT: THIS ENZYME IS COMPOSED OF SEVEN SUBUNITS FWDA (65 kDa), FWDB (53 kDa), FWDC (31 kDa), FWDD (15 kDa), FWDE, FWDF, AND FWDG (BY SIMILARITY).
The tungsten formylmethanofuran dehydrogenase from Methanobacterium

A Unique physiological and pathogenic features of Leptospira

Interrogans revealed by whole-genome sequencing.";

Nature 422:888-893(2003).

-I-FUNCTION: Peptide chain release factor I directs the termination

of translation in response to the peptide chain termination codons

UAG and UAA (By similarity).

-I-SUMLEALULAR LOCATION: Cytoplesmic.

-I-SUMLARITY: Belongs to the prokaryotic/mitochondrial release

                                                                                                                                          Porphyronogas graduates of the Orla paragonic parterium.

J. Bacteriol. 185:5591-5601(2003).

-!- FUNCTION: Acts as a co-chaperone. Stimulates, jointly with grpB, the ATPase activity of dnaK (By similarity).

-!- COFACTOR: Binds 2 zinc ions per monomer (By similarity).

-!- SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).

-!- SUMILARITY: Belongs to the dnaJ family.

-!- SIMILARITY: Contains 1 J domain.

-!- SIMILARITY: Contains 1 CR domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PROSITE; PS00636; DNAJ 1; 1.

TISSUB SPECIFICITY: EXPRESSED IN THE DEVELOPING LIMB BUD WHERE IT
IS RESTRICTED TO THE MESENCHYME ALONG THE PROXIMAL-DISTAL AXIS.
ALSO FOUND IN DEVELOPING GUT AND URCGENITAL TRACT. IN ADULT
TISSUE, BOTH FORMS FOUND IN KIDNEY BUT ONLY ISOFORM 1 IS EXPRESSED

FUNCTION: Furin is likely to represent the ubiquitous endoprotease
               activity within constitutive secretory pathways and capable of cleavage at the RX(K/R)R consensus motif (By similarity).
CATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Xaa-Arg-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys. Releases albumin, complement component C3 and von Willebrand factor from their
                                                                                                                                                                                               Expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R FLYBase; SG0-10459; Furz.

Genome Res. 12:532-542(2002).
-!- FUNCTION: Part of a complex that catalyzes the formation of
methyl-coenzyme M and tetrahydromethanopterin from coenzyme M and
methyl-tetrahydromethanopterin. This is an energy-conserving,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PATHWAY: Methanogenesis from carbon dioxide; sixth step.
SUBUNIT: The complex is composed of 8 subunits; mtra, mtrs, mtrc, mtrc, mtrc, mtrc and mtrH (By similarity).
SUBCELLULAR LOCATION: Integral membrane protein (Potential).
SIMILARITY: Belongs to the mtrC family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Detection of collagen degradation peptide(s) - used for detecting, diagnosing and monitoring degenerative and inflammatory disorders. WPI; 1991-193334/26.

The peptide is part of a larger molecule to which it is linked via the lysine in the 2 posn: Glu-Hyl-Ala-Gly-Gly-Phe. . . (AAR12514) CC | Glu-Hyl-Ala-Gly-Gly-Phe. . . (AAR12514) CC | Glu-Hyl-Ala-Gly-Gly-Phe CC | Hyl Hyl-Hyl-Hyl = hydroxylysl pyridinion. The peptide, or a similar molecule hadring the pyridinium ring cleaved, can be detected in body fluid using a specific binding partner. The amt. present gives an indication of bone resorption and can be used to screen for osteoarthritis and similar degenera- tive and inlammatory disorders. The peptide was prepd. from human urine using reverse phase and molecular sleve chromatography. See also AAR12510-R12513. (Updated on 25-MAR-2003

The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody (Ab) which binds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen (cartilage) resorption in vivo, for distinguishing between resorption of cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              type

Determination of collagen fragments in body fluids can be achieved by communoassay using antibodies directed against synthetic peptides derived from collagen which contain sites of potential crosslinking. The method compared to disorders of collagen which contains itses of potential crosslinking. The method compared to disorders of collagen may indicate osteoporosis, metastatic progression, Paget's disease, hyperthyroidism or other conditions involving excessive bone resorption; degredation of type II collagen may indicate rheumatoid arthritis or osteoarthritis; and of type II collagen, vaculitis syndrome). The method can also be used to assess the toxicity of a compound and to test drugs for their effect on collagen metabolism. The sequences of collagen fragments on which the synthetic peptides were based are described in AAR17705.07 and ARR17709-12. This clopetide sequence is a potential cross-linking site in collagen alphal (type III) and is found at the C-terminus. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

It represents a potential crosslinkable site of collagen II. The invention is based on the discovery of the presence of particular collagen fragments in body fluids of patients compared with those of healthy subjects. These fragments are generated upon collagen degradation and are partly characterised by the presence of potential sites for crosslinking. A method for assaying collagen fragments in a body fluid sample is based on the competitive binding of collagen fragments in the sample and of synthetic peptides derived from collagen to immunological binding partners. When considering the degradation of type III collagen, the assay can be used as a means of identifying the presence of vasculitis syndrome. The assay can also be used to monitor the progress of therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assaying type I collagen fragments for diagnosing osteoporosis in postmenopausal woman, involves contacting body fluid with synthetic collagen peptide and antibody and quantifying by competitive binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The invention relates to immunoassays for measuring type II collagen (aartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody fluid sample, and correlating any detected binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen non-mineralized and mineralized cartilage, and for measuring total cartilage resorption in vivo. The present sequence represents a peptide based on the carboxy-terminal telopeptide sequence of human collagen II, to which an antibody binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; collagen type III; osteoporosis; bone resorption; Paget's disease; hyperparathyroidism; rheumatoid arthritis; osteoarthritis; therapy; vasculitis syndrome; toxic substance; tissue degradation; alphal(III).
                                                                                                                                                                                                                                                        Assay for detecting cross-linked telopeptide analytes indicative of type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                      II collagen resorption in vivo in a body fluid sample, comprises contacting the sample with an antibody which binds to the analyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The invention relates to a peptide synthesised to match an alphal(I) or alpha2(I) telopeptide component of a cross-linked telopeptide degradation of product of type I collagen. The method is useful for assaying collagen to fragments in animal body fluids, for determining the degradation of human collagen types I, II and III and for diagnosing the presence of disorders associated with the metabolism of collagen, especially osteoporosis. The peptide is used for assessing the impact of drugs on collagen metabolism. The peptide is useful in methods to assess an abnormal condition of a subject for e.g. excessive bone resorption which shows the presence of an costeoporotic condition or the metastatic progress of a malignancy, agent's disease and hyperparathyroidism. Disease states involving connective tissues can be monitored by determining collagen degradation, examples are collagen type III degradation associated with rheumatoid arthritis, osteoarthritis, and collagen type III degradation in continuously, application of these assays can also be used to monitor the progress of thorapy administered to treat these or other conditions and as a measure of toxicity, since the administration of toxic substances of the insure degradation. The present sequence is human collagen type III alpha1(III) C-terminal peptide used for synthesising a peptide used in the invention
                                                                                 peptides that match alpha 1 or 2(I) telopeptide component of telopeptide degradation product of type I collagen useful sing disorders associated with collagen metabolism e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABB80730 standard; peptide; 7 AA.

                                                                                                                                                               The invention relates to a method for assaying type I collagen fragments (1) in body fluid. The method involves treating the test sample with: (i) synthetic peptide, immobilised on a support; and (ii) immunological binding partner, reactive with the synthetic peptide, so that (I) and the synthetic peptide compete for binding, and (I) are quantified by measuring the binding of the binding partner to the synthetic peptide. The method is used to diagnose disorders of collagen metabolism. The method is used to diagnose disorders of collagen metabolism, osteogenesis imperfecta, neoplastic growth of collagenous tissue, dwarfism, theumatoid arthritis or vasculitis, also for clinical testing of drugs to assess their effect on collagen metabolism. Sequences ABBB0716-732 represent synthetic peptides derived from collagen used for assaying type I, II and III collagen fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Assaying type II collagen fragments in a body fluid sample, for determining abnormalities in collagen metabolism, e.g. in Paget's disease or Marfan's syndrome, comprises contacting the fluid with a synthetic type II collagen alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Collagen; bone resorption; collagen metabolism; Paget's disease;

The present sequence represents a peptide derived from collagen type III alphal. The peptide has potential sites for crosslinking to various collagens. The specification describes a method for assaying type II collagen fragments in a body fluid sample. The method comprises contacting the body fluid with a synthetic peptide consisting essentially of a type II collagen alphal maino acid sequence that competes with the collagen fragments for binding with the immunological binding partner. The method is useful for assaying collagen fragments in body fluids. The method is particularly useful in assays for measuring bone resorption rates in patients or in healthy subjects. The method may be used for determining abnormalities in collagen metabolism, especially in Paget's disease, Marfan's syndrome, osteogenesis imperfecta, neoplastic growth in collagenous tissue, dwarfism, rheumatoid arthritis, osteoarthritis or vasculitis syndrome. The method may be used for determining the degradation of human collagen of type I, II and III. It also can be used during clinical testing of new drugs to assess the impact of these drugs on collagen metabolism. The assays, can be used as a measure of toxicity, since the administration of toxic substances often results in tissue metabolis condition. Thus, the assays may be applied in any situation where the condition, treatment or effect of substances druckly administered to the condition, treatment or effect of substances directly administered to the

          (cartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody (Ab) which binds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen (cartilage) resorption in vivo, for distinguishing between resorption of non-mineralized and mineralized cartilage, and for measuring total synthetic peptide based on the carboxy-terminal telopeptide sequence of human collagen type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to immunoassays for measuring type II collagen (cartilage) resorption in vivo.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to immunoassays for measuring type II collagen (cartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody (Ab) which binds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is any detected binding to the physiological contilage) resorption in vivo, for distinguishing between resorption of non-mineralized and mineralized cartilage, and for measuring total cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of human collagen type II
cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of human collagen type III
                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Assay for detecting cross-linked telopeptide analytes indicative of II collagen resorption in vivo in a body fluid sample, comprises contacting the sample with an antibody which binds to the analyte.
                                                                                               ;

The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody (Ab) which binds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen (cartilage) resorption in vivo, for distinguishing between resorption of non-mineralized cartilage, and for measuring total cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Assay for detecting cross-linked telopeptide analytes indicative of type II collagen resorption in vivo in a body fluid sample, comprises contacting the sample with an antibody which binds to the analyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The invention relates to immunoassays for measuring type II collagen (cartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody fluid sample, and correlating any detected binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen (cartilage) resorption in vivo, for distinguishing between resorption of non-mineralized and mineralized cartilage, and for measuring total cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                               Assay for detecting cross-linked telopeptide analytes indicative of type II collagen resorption in vivo in a body fluid sample, comprises contacting the sample with an antibody which binds to the analyte.
                                                                           Type II collagen; immunoassay; cartilage; telopeptide; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Type II collagen; immunoassay; cartilage; telopeptide; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 26; DB 4; Length 9; 100.0%; Pred. ```
The invention relates to immunoassays for measuring type II collagen (cartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample which hinds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen (cartilage) resorption in vivo, for distinguishing between resorption of non-mineralized and mineralized cartilage, and for measuring total cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of
                                                                                                                                                                                                                                                                   Assay for detecting cross-linked telopeptide analytes indicative of type II collagen resorption in vivo in a body fluid sample, comprises contacting the sample with an antibody which binds to the analyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

Sequence 39, Application US/10009999A
; Patent No. 6602980
; GENERAL INFORMATION:
APPLICANT: Eyre, David R.
; TITLE OF INVENTION: SYNTHETIC PEPTIDES FOR COLLAGEN RESORPTION ASSAYS

US-10-009-999A-39

RESULT 2

NAME/KEY: MISC FEATURE

OTHER INFORMATION: synthetic peptide corresponding to carboxy-terminal

CHER INFORMATION: telopeptide sequence of human type III collagen

US-10-009-999A-44
